ANTI-BACTERIAL PROPERTIES OF PROSOPIS CINERARIA (L.) DRUCE

Indhiramuthu Jayashree*, DH. Geetha and M. Rajeswari
PG and Research Department of Botany, Vellalar College for Women, (Autonomous), Erode, Tamil Nadu, India - 638012.

Abstract
In the present study, the antibacterial efficacy of ethanol and aqueous extracts of leaf of Prosopis cineraria was examined against four bacterial species (Bacillus subtilis, Staphylococcus aureus, Klebsiella pneumoniae and Proteus mirabilis) using agar well diffusion method. Results showed that both the plant extracts exhibited a dose-dependent inhibition of microorganisms. Ethanol extracts showed higher degree of antibacterial activity than aqueous extracts. The phytochemical test confirmed the presence of bioactive secondary metabolites like alkaloids, tannins, flavonoids, saponins, steroids, terpenoids and glycosides. The plant has high value of secondary metabolite which in turn is responsible for its antioxidant and antibacterial activity.

Key words: Prosopis cineraria, agar well diffusion assay, antibacterial activity, ethanol and aqueous extracts.

INTRODUCTION
In recent years, the indiscriminate use of synthetic drugs against microbial pathogens has resulted in mutation of strains making them insensitive to these chemical agents leading to the global hazard of drug resistance. The scientists of the 21st century are generally reviving our traditional knowledge and are screening various parts of plants scientifically, in search of newer lead compounds having antimicrobial efficacy1. It is high time the hidden wonders of plant molecules were revived with the modern tools of target-based screening to develop newer advanced generation of antimicrobials with novel modes of action. Prosopis cineraria is a flowering tree belonging to the family Fabaceae and contains approximately forty four species2. It is native to Western and South Asia, including Afghanistan, Iran, India and Pakistan. Its common names include Khejr (India), Jand and Kandi (Pakistan). It is the state tree of Rajasthan (India) and provincial tree of the Sindh province of Pakistan3. Different parts of the plant are useful for the treatment of many diseases like skin diseases, piles, worms, vertigo and dysnomia4, protection from miscarriage, eye diseases, snake bite, asthma, bronchitis, dysentery, leucoderma, leprosy and muscle tremors5.

MATERIALS AND METHODS

Plant Collection and Extraction
The leaves of Prosopis cineraria were collected from Thindal, Erode district and were authenticated and deposited at the PG and Research Department of Botany, Vellalar College for Women, Erode (Tamil Nadu), India. Fresh leaves were collected and air-dried at room temperature and then homogenized to obtain coarse powder. The powder leaf was extracted with the solvent ethanol by hot extraction using soxhlet apparatus, collected and stored in a vial for further analysis.

Phytochemical Screening
Preliminary Phytochemical analysis of leaf was undertaken and tested for various antibacterial phytoconstituents7,8.

Antibacterial Assay
Agar Well Diffusion Method
The antibacterial activity of ethanolic and aqueous leaf extracts of Prosopis cineraria was evaluated by well diffusion method9. The inoculation of microorganisms was prepared from bacterial culture. About 20ml of Muller Hinton agar medium was poured in a sterilized petridish and allowed to solidify. One drop...
of bacterial strain was spread over the medium by a rod. Wells of 5mm in diameter and about 2cm apart were punctured in the culture medium using sterile cork borers. Varying concentrations of the ethanol and aqueous leaf extracts (25, 50, 75 and 100µg/ml) was added to the wells separately and the plates were incubated at 37°C for 24h. Streptomycin (50µg/ml) the standard antibiotic was used as positive control. Antibacterial activities were assessed by measuring inhibition zone in diameters and the results were given in relative magnitude of inhibition (RMI).

Microorganisms Tested
The test microorganisms used in the present study were
Gram positive: 
Bacillus subtilis, Staphylococcus aureus
Gram negative: 
Proteus mirabilis, Klebsiella pneumoniae.

Bacterial Strains used in this study were purchased from Kovai Medical College Hospital (KMCH), Coimbatore. Bacteria were cultured overnight at 37°C in Muller and Hilton Broth (MHB) 72hours in Potato Dextrose Broth and used as inoculum.

RESULTS AND DISCUSSION
The basic theme and fundamental need of this plant oriented project was to explore the hidden medicinal potential of the plants. These secondary metabolites comprises of alkaloids, flavonoids, glycosides, tannins, saponins, steroids and triterpenoids as shown in the Table 1. The result of the antibacterial activities of the ethanol and aqueous leaf extracts of P. cineraria compared with that of the standard antibiotic are shown in Tables 2 and 3. The ethanol extract showed maximum activity against Staphylococcus aureus and Klebsiella pneumoniae at 100µg/ml concentration which was comparable with the standard antibiotic drug at 50µg/ml concentration (Table 2). On the other hand, the aqueous extract showed maximum inhibitory effect against Proteus mirabilis followed by Klebsiella pneumoniae at 100µg/ml concentration. Earlier the phytochemical and antimicrobial properties were reported by researchers from dried unripe pods, seeds, stem, leaf and bark, roots, leaves and fruits of Prosopis cineraria.

CONCLUSION
Plants are the biggest source of medicine in future. The present study exhibited the antibacterial effect of ethanolic and aqueous extracts of Prosopis cineraria against Bacillus subtilis, Staphylococcus aureus, Klebsiella pneumoniae and Proteus mirabilis. The obtained activity may be due to the presence of flavonoids and tannins (presence is confirmed by the preliminary phytochemical studies). The inhibitory effect of the extracts justified the medicinal use of P.cineraria .The plant extracts thus provides safe, easy, effective and practical solutions to every day ailments leaving behind no toxins and creating a clean, pleasant atmosphere. Further studies are under progress to characterize the active principles.
